

Summary of Table 1

R26124047 李宗祐

This paper discusses how to display a table well.

Considering columns:

1. Stratified by exposure (RCT/cohort/cross-sectional/case-control) / disease (case-control)
2. don't include p-value
3. If there is missing data, add columns for (1) response sample, (2) complete case sample or imputed sample, and (3) a total column.

Considering rows:

1. include all variables in final model
2. show variables both as analyzed and as collected.
3. if interested, including possible confounders and effect modifiers

Considering cells:

1. n (%) for categorical variable (percentage should be integer), mean (SD) for continuous variable, median (min-max) or median (Under quantile - Upper quantile) for skewed continuous variable.
